

COMMUNICATION BRIEF: KENYA NUTRITION SITUATION ARID AND SEMI-ARID AREAS SHORT RAINS ASSESSMENT, FEBRUARY 2019

1.0. Key facts and messages

- According to the integrated Phase Classification conducted in February 2019, the nutrition situation is currently stable across the Arid and Semi-Arid (ASAL) areas though still above emergency thresholds - Global Acute Malnutrition (GAM) ≥ 15 percent in selected areas.
- The stable nutrition situation is attributed to the positive impacts of the 2018 long rains which have mitigated the otherwise negative effects of the below average 2018 short rains
- The nutrition situation is projected to remain stable in most areas however there is potential for deterioration if 2019 long rains perform poorly (Figure 2).
- Poor child care practices and environment, morbidities and inadequate access to health care services continue to negatively impact on health and nutrition situation especially in arid counties
- Continued implementation of the high impact health and nutrition interventions with focused effort to improve coverages in counties with inadequate coverages is required
- The estimated number of children 6 to 59 months requiring treatment of acute malnutrition is 541,309 (severe acute malnutrition 113,941 and moderate acute malnutrition 427,368) while 30,712 pregnant lactating women (PLW) require treatment (Table 1).

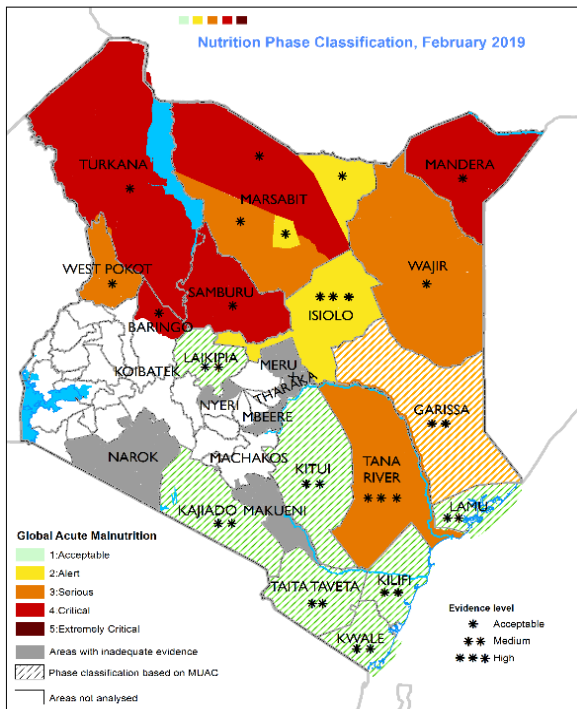

Figure 1: Current nutrition situation

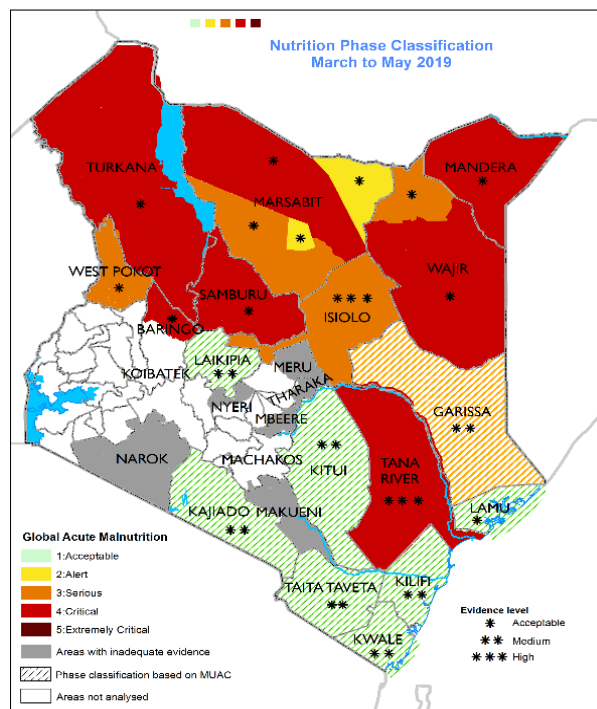

Figure 2: Projected nutrition situation

Table 1: Summary of total caseload and targets, February 2019

County	Global Acute Malnutrition children 6 to 59 months		Severe Acute Malnutrition, Children 6 to 59 Months		Moderate Acute Malnutrition, Children 6 to 59 Months		Pregnant and Lactating Women	
	Total Caseload	Target	Total caseload	Target	Total caseload	Target	Total caseload	Target
ASAL	472,756	259,313	91,740	68,805	381,017	190,508	27,959	27,959
Urban	68,552	39,826	22,201	16,651	46,351	23,176	2,752	2,752
Grand Total	541,308	299,139	113,941	85,455	427,368	213,684	30,712	30,712

2.0. Situation Overview and Key drivers

Integrated Phase Classification (IPC) for acute malnutrition has been conducted as part of the Short Rains Assessment (SRA). The analysis shows the nutrition situation is currently stable across the Arid and Semi-Arid (ASAL) areas though still critical in some counties. Turkana, Samburu and Mandera counties as well as East Pokot and North Horr sub-counties have remained at critical level (Phase 4; GAM WHZ 15.0 - 29.9 percent) while Wajir, Tana River, West Pokot, Garissa and Laisamis counties are at serious level (Phase 3; GAM WHZ 10.0 -14.9 percent). Isiolo, Saku and Moyale are classified as alert (Phase 2; GAM WHZ ≥ 5 to 9.9 percent) while Laikipia, Kitui, Kajiado, Taita Taveta, Kilifi, Kwale and Lamu are at acceptable level (Phase 1; GAM WHZ <5 percent). Section 6 provides the latest prevalence of acute malnutrition.

Nutrition situation is likely to remain stable across the areas during the projection period except for Wajir-Pastoral and Tana River which are likely to deteriorate to critical and Isiolo to serious phase respectively. While the nutrition situation is projected to remain stable in most areas, there is potential for fast deterioration should the 2019 long rains performance be poor.

The negative effects of the below average 2018 short rains were offset by the positive impacts of the 2018 long rains which resulted in substantial regeneration of pasture, improved crop production and subsequently improved food and nutrition security situation. As a result, stable food prices and access to markets, favorable terms of trade, reasonable milk availability in pastoral and agro-pastoral areas and food stocks in agricultural areas were recorded during the period under review. However, poor child feeding and care practices, low level of maternal education, reliance on rain fed agriculture and livestock production, and poor access to health care services continue to negatively impact health and nutrition situation especially in the arid counties. A summary of contributory factors is provided in section 7 for each analysis area.

3.0. Recommendation for action

- Closely monitor the performance of the 2019 long rains, update the nutrition situation projected if needed - for timely program adjustment and scale up should the rains perform poorly
- Update contingency and response plans including response to current outbreaks
- Continued implementation of the high impact health and nutrition interventions with focused effort to improve coverages in counties with inadequate coverages
- Closely monitor implementation of the detailed recommendations provided in the full nutrition situation report
- Scale up current levels of health and nutrition interventions in Wajir and Tana river counties to mitigate the effects of the projected deterioration
- Close monitoring of IMAM program admissions versus targets at health facility and community level to better inform program targeting

4.0. Detailed number of children who are acutely malnourished and in need of treatment

The estimated number of children 6 to 59 months requiring treatment of acute malnutrition is 541,309 (severe acute malnutrition 113,941 and moderate acute malnutrition 427,368) with more increase observed in severe acute malnutrition (SAM) caseloads (Figure 3 and Table 2). The increase was mainly informed by the review and consideration

of SAM program admissions where over achievement of SAM program admission was recorded surpassing the targets for 2018 despite modest coverages being observed during coverage assessments (Figure 4). The capacity of the health system has been improving over the past several years in relation to continued recruitment of health workers, increasing number of health facilities and improved delivery of commodities directly to health facilities. Hence several counties surpassed their respective targets, and in some cases the estimated total caseload leading to adjustment of estimates to fit to the actual admissions observed.

The estimated number of pregnant lactating women (PLW) requiring treatment of acute malnutrition is 30,712.

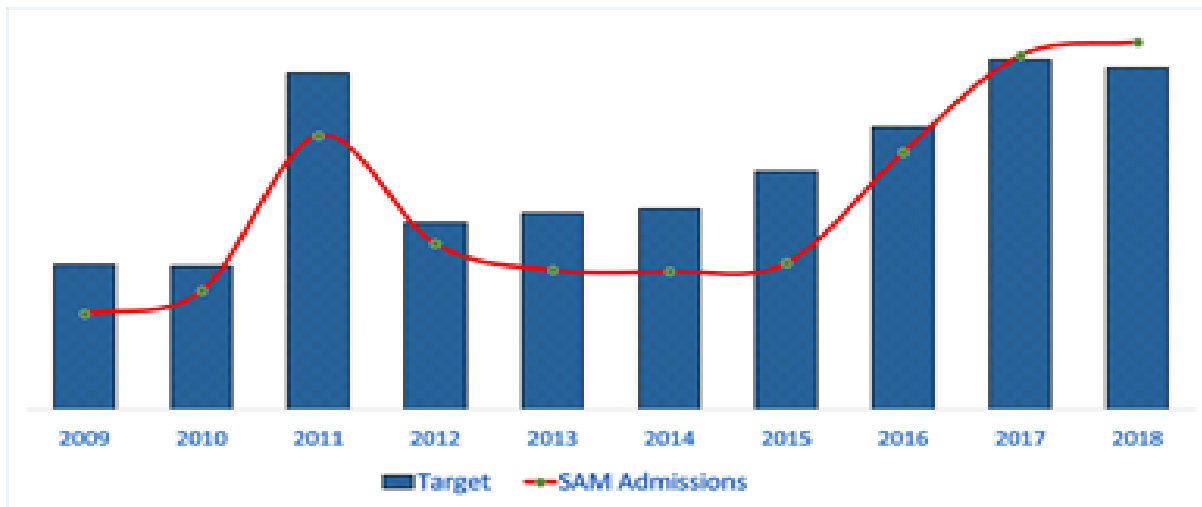

Figure 4: Trends of Admission in SAM Reported from Health Facilities Versus Annual Targets

5.0. Process and Methodology

Analysis during the workshop applied the global protocols for Integrated Phase Classification for Acute Malnutrition Version 3. A three days training was done to analysis team on the protocols with continued technical support throughout the analysis and report writing process. Groups with experienced technical leads were formed to allow for peer support especially for new analysts and plenary sessions held to allow for further technical review, inputs and consensus. Data was gathered from multiple sources such as representative surveys, mass screening, routine data from the DHIS2, outbreak reports and the National Drought Management Authority sentinel surveillance. Only data of acceptable quality was used in the analysis. The analysis resulted to a current situation update and projection of the situation. Key drivers; both food security and non-food security related factors were identified using the UNICEF conceptual framework as laid out in the analysis work sheet. Since both IPCs were conducted simultaneously, results from the IPC for acute malnutrition were included Food Security analysis and results from Food Security IPC were also included in the IPC for acute malnutrition analysis. Finally, response actions and risk factors to monitor were identified.
